HackerRank Skills Certification Test

There was not an option to view my specific score on the exam, but I did pass as can be seen from the above screenshot.

This certification test was more challenging than I had expected, involving building a form validation component using React state management as well as HTML/CSS. It also included writing a short utility function in JavaScript to return a function that determines if a specified value was found in an input array. Using what I had learned from this class, I was able to solve these problems as well as the multiple-choice questions regarding the implementation of certain stylings and animations with CSS. The state management and CSS lessons proved to be particularly helpful when taking this exam as I had to use both to solve the form validation problem. Overall, I found the lessons taught in this class to be helpful especially when taking this exam.
